Pollinator: an animal (like a bee) that helps plants reproduce by transferring pollen from one flower to another. This process produces fruits and seeds.

Predator: an animal that hunts and eats other animals.

Prey: animals that are eaten by other animals.

Decomposer: an organism, especially a soil bacterium, fungus, or invertebrate, that breaks down organic material.

Invertebrate: an animal with no backbone.

Beneficial Insect: insects (and other arthropods) that help control pests, improve soil quality, and support other wildlife.

Insect Evidence: something that shows you that an insect has been present. For example; a spider web, a tunnel in the dirt, or a leaf with chew markings.
